THOMAS, LUCY M

ART UNIT PAPER NUMBER

2836

DATE MAILED: 09/21/2006

Please find below and/or attached an Office communication concerning this application or proceeding.

| | | | |
|------------------------------|--------------------------------------|--|--|
| Office Action Summary | Application No. 10/695,978 | Applicant(s) SCHWEITZER ET AL. | |
| | Examiner Lucy Thomas | Art Unit 2836 | |

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 10 July 2006.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-3, 5-8, 10-11, 14-17 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-3, 5-8, 10-11, 14-17 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

Claim Rejections - 35 USC § 102

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

2. Claims 1-2 and 6 are rejected under 35 U.S.C. 102(b) as being anticipated by Guzman-Casillas et al. (US 6,028,754). Regarding Claim 1, Guzman-Casillas discloses a system (Figures 6 and 9) for improving the performance of a distance type protective relay for power systems, wherein, the relay includes a calculation circuit responsive to voltage and current values from the power line to produce a quantity (m value) analogous to the distance between the relay and a fault on the power line, wherein the quantity is applied to a distance element for comparison of said quantity with a setting reach value for a selected zone of a protection (Column 2, lines 17-35, Column 8, lines 15-36), the system comprising: a filter circuit responsive to said quantity for filtering said quantity before the quantity is applied to the distance element, resulting in the noise attenuation of the quantity (see elements 72, 66; Column 8, lines 4-14); and a control circuit for controlling the application of the filtered quantity to the distance element such that the filtered quantity is applied only when said quantity is above a preselected first threshold value and below a preselected second threshold value (Column 9, lines 61-67, Column 10, lines 1-9, 60-63, Column 11, lines 1-9).

The reference teaches comparator 72 as part of a filter circuit, which performs filtering and noise attenuation of the signal, and element 66 which performs the filtering of the signal when CCVT transients are present (Column 8, 1-4, Column 9, lines 59-67, Column 10, lines 1-10), that meet the claim limitation, because the claim is not specifying a particular filter configuration, and therefore the reference meets the limitations of Claim 1. The reference teaches the element 66 as a timer, which delays the signal for transients to die down, and a timer has capacitor and resistor elements for the delay to occur and thus perform the filtering function.

Regarding Claim 2, Guzman-Casillas et al. discloses the said system, wherein the preselected first threshold is a selected percentage of the setting reach value (Column 10, lines 10-15).

Regarding Claim 6, Guzman-Casillas et al. discloses a system further comprising a circuit for precharging the filter to the preselected second threshold value when said quantity decreases to the preselected second threshold value from said high value, in response to fault (Figure 9, Column 10, lines 60-63, Column 11, lines 1-9).

Claim Rejections - 35 USC § 103

3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

4. Claims 3, 5, 7- 8, 10-11, and 14-17 are rejected under 35 U.S.C. 103(a) as being unpatentable over Guzman-Casillas et al. (US 6,028,754). Regarding Claim 3, the

recited limitations are not considered inventive because the threshold is typically set based on the tolerance for error, which would result in 100% minus the error plus a safety margin as recited by the Claim. The claims specify a safety margin of 5% and Claim 5 further specifies an error of 8%. However, it has been decided that where the prior art disclose the general condition of a claim, it is not inventive to discover the optimum or workable ranges by routine experimentation. *In re Aller*, 220 F.2d 454, 456 105 USPQ 233, 235 (CCPA 1955).

Regarding Claim 7, the reference does not disclose a specific value for the threshold. However, it would have been obvious that the threshold value may be set approximately four times the setting reach value as recited in Claim 7. It has been decided that where the prior art disclose the general condition of a claim, it is not inventive to discover the optimum or workable ranges by routine experimentation. *In re Aller*, 220 F.2d 454, 456 105 USPQ 233, 235 (CCPA 1955).

Regarding Claim 8, Guzman-Casillas et al. discloses an apparatus (Figures 6 and 9) for selecting one of a filtered m value and an unfiltered m value provided to a distance element of a protective relay providing protection for a transmission line of a power system, the protective relay including a calculation circuit adapted to provide the unfiltered m value indicative of a distance between the protective relay and a fault, and a filter 66 adapted to filter the unfiltered m value to form the filtered m value, the apparatus comprising: a first comparator 76 including an output determined by a first input configured to receive the unfiltered m value and a second input configured to receive a first percentage of a zone reach value; a second comparator 72 including an

Art Unit: 2836

output determined by a first input and a second input; and a logic circuit 74, coupled to the first comparator and the second comparator, the logic circuit providing a switched output, the switched output being either the filtered m value or the unfiltered m value based on the values of the first comparator and the second comparator (Column 9, lines 61-67, Column 10, lines 1-9, 60-63, Column 11, lines 1-9). Guzman-Casillas does not specify the inputs to the comparators as recited in the claim, as the comparator 72 does the filtering function and comparator 76 compares the zone reach value and unfiltered m value to decide whether fault occurred in the zone reach value. It would have been obvious to those skilled in the art at the time the invention was made to modify Guzman-Casillas's apparatus and to provide the inputs to the comparators to perform the filtering function and comparison to increase the accuracy of the calculations and thus to meet the system performance requirements.

Regarding Claims 10-11, Guzman-Casillas disclose that the filter is charged immediately after the unfiltered m value is equal to or less than the first percentage of the zone reach value, the unfiltered m value equaling the first percentage of the preselected setting indicating an occurrence of a fault in the transmission line (Column 8, lines 37-50).

Regarding Claims 11 and 17, Guzman-Casillas discloses filter operation is defined by $msk = -0.15 * mk + 0.135$ (which differs from that recited in Claim, $msk = 0.6 * mk + 0.135$ as the inputs to the comparators differs).

Regarding Claims 14-16, the recited steps of the method claims would necessarily be performed when using the apparatus of Claims 8 and 10. Therefore, please see the rejection of Claims 8 and 10-11 above.

Response to Arguments

5. Applicant's arguments filed on 7/10/2006 have been fully considered.

Regarding Applicant's statement that the reference does not refer to the noise attenuation provided by the filter: The reference teaches a comparator 72 as part of a filter circuit, which performs filtering and noise attenuation, and element 66 which performs the filtering of the signal when CCVT transients are present (Column 8, 1-4, Column 9, lines 59-67, Column 10, lines 1-10) that meet the claim limitation, because the claim is not specifying a particular filter configuration, and therefore the reference meets the limitations of Claim 1. The reference teaches the element 66 as a timer, which delays the signal for transients to die down, and a timer has capacitor. The comparator taught by the reference performs filtering to meet the smoothness requirements of the signal.

Conclusion

6. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. US 5,703,745, US 5,349,490, US 5,325,061, US 4,821,137.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Lucy Thomas whose telephone number is 571-272-
